Clinical pharmacokinetics. Pharmacokinetics can be simply described as the study of 'what the body does to the drug' and includes: • the rate and extent to which drugs are absorbed into the body and distributed to the body tissues. • the rate and pathways by which drugs are eliminated from the body by metabolism and excretion.

Clinical pharmacokinetics is thus a fundamental knowledge base that pharmacists require to ensure effective practice of pharmaceutical care. The aim of this chapter is to provide the practising clinical pharmacist with the appropriate knowledge and skills of applied clinical pharmacokinetics, which can be applied in everyday practice.

Pharmacokinetics and pharmacodynamics describe, respectively, the amount of drug in the body at a given time and the pharmacologic effects caused by the drug. 1 Pharmacokinetics describes the movement of a drug into, within, and out of the body over time, whereas pharmacodynamics explains the effects the drug has on the body that result in a clinical response.

Understanding the dose–concentration–effect relationship is a fundamental component of clinical pharmacology. Interpreting data arising from observations of this relationship requires the use of mathematical models; i.e. pharmacokinetic (PK) models to describe the relationship between dose and concentration and pharmacodynamic (PD) models describing the relationship between concentration ...
