A computer cluster is a set of computers that work together so that they can be viewed as a single system. Unlike grid computers, computer clusters have each node set to perform the same task, controlled and scheduled by software.. The components of a cluster are usually connected to each other through fast local area networks, with each node (computer used as a server) running its own ...

Computer cluster - Wikipedia

Concurrent computing is a form of computing in which several computations are executed concurrently—during overlapping time periods—instead of sequentially—with one completing before the next starts.. This is a property of a system—whether a program, computer, or a network—where there is a separate execution point or "thread of control" for each process.
