The Parks–Bielschowsky three-step test, also known as Park's three-step test or Bielschowsky head tilt test, is a method used to isolate the paretic extraocular muscle, particularly superior oblique muscle and trochlear nerve (IVth cranial nerve), in acquired vertical double vision. It was originally described by Marshall M. Parks.

composed of closely packed cones in the eye. It is located in the center of the macula lutea of the retina. The fovea is responsible for sharp central vision (also called foveal vision), which is necessary in humans for activities for which visual detail is of primary importance, such as reading and driving. The fovea is surrounded by the parafovea ...

Adalimumab is the biologic agent with the highest-quality evidence for the treatment of nonanterior NIU in adults (grade A recommendation). It is approved in the United States for the treatment of NIU, IU, posterior uveitis, and panuveitis; in Europe indications are for adults with inadequate response to CS, patients in need for steroid-sparing therapy, or in whom CS treatment is inappropriate.

Anterior Uveitis

Biometry is the method of applying mathematics to biology. The term was originally used by Whewell in the 1800s for calculating life expectancy. The refractive power of the eye primarily depends upon the cornea, the lens, ocular media, and the axial length of the eye. When planning for cataract surgery, in order to achieve the desired post-operative refraction, the required power of the ...
